700 SERIES FAMILY

BERMAD 700 series are hydraulically operated, oblique or angle pattern control valves with excellent flow capacity and double chamber unitized actuator, that can be disassembled from the body as a separate integral unit.

The valves hydrodynamic body is designed for unobstructed flow path and provides excellent and highly effective modulation capacity for high differential pressure applications, with minimal noise and vibrations.

The 700 series meet all flange connection standards.

700 CLASSIC

With high flow capacity and double chamber actuator the 700 classic is the father of the family, available in a variety of construction materials and configurations.

700 SIGMA EN

Full port valve with high cavitation resistance and extraordinarily high flow capacity enabling optimized use of resources and minimizing energy costs.

700 SIGMA ES

Designed mainly for regulating applications with high risk of cavitation, the valve achieves the optimal performance under variable flow velocities in pipes.

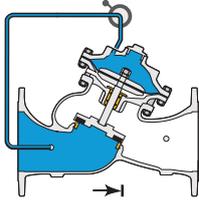

International Standards

| | | |
|---|----------------------------------|---|
|  | INTERNATIONAL | ISO 9001-2015 Certified Quality Assurance System |
| ISO 9001 | INTERNATIONAL | ISO 9001-2015 Certified Quality Assurance System |
|  | WRAS, UK | The product complies with the Water Regulation Advisory Scheme of UK and BS 6920 |
|  | DVGW, Germany | Compliance with the European Standard EN 1074 – Valves for water supply and German Standards KTW and W270 |
|  | ACS, France | Tests are based on the French Sanitary standard |
|  | BELGAQUA, Belgium | The product complies with the Belgian Standards for materials in contact with drinking water |
|  | NSF USA | The product complies with the NSF/ ANSI 61 Std. – Valves for Water Supply and NSF 372 low lead |
|  | Bulgarcontrola, Bulgaria | Compliance of Bermad Automatic Control Valves with the sanitary requirements of Bulgaria and with the EN 1074 European Standard for Valves for Water Supply |
|  | PZH, Poland | Compliance of Bermad Automatic Control Valves with the Polish sanitary requirements |
|  | AUSTRALIA AS 5081 and water mark | Control valves for waterworks purposes |
|  | RUSSIAN Customs Union | Valves For Water Supply |
|  | KOREA | Valves For Water Supply |

BERMAD valves comply with a wide range of international standards. Please consult with BERMAD about the compliance of a required model to a specific standard

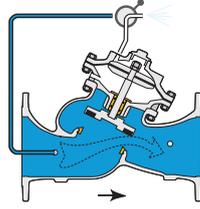

On-Off Modes

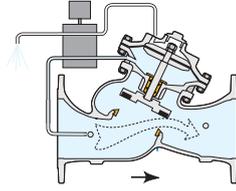

Closed Position

Line pressure applied to the upper control chamber of the valve creates a superior force that moves the valve to the closed position and provides drip-tight sealing.

Open Position

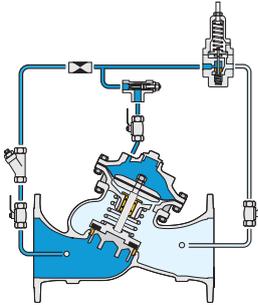

Discharging the pressure in the upper control chamber to atmosphere or some other lower pressure zone causes the line pressure acting on the seal-disk to move the valve to the open position.

Powered Open Position

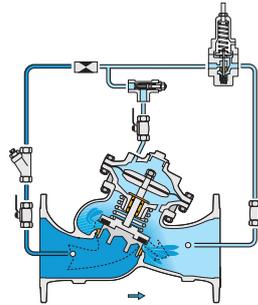

Line pressure is applied to the lower control chamber as pressure in the upper control chamber is vented. This, together with the line pressure acting on the seal-disk, creates a force that powers the valve to the open position.

2-Way Modulating Mode - Pressure Reducing

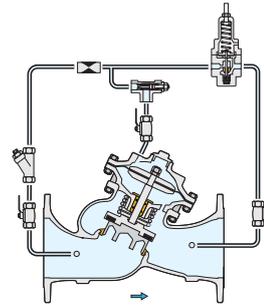

Closed Position

The closed adjustable pilot valve traps line pressure in the upper control chamber. The resulting superior force moves the valve to the fully closed position and provides drip-tight sealing.

Modulating Position

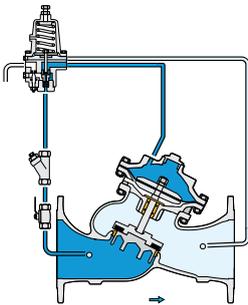

The pilot valve senses line pressure changes and opens or closes accordingly. It controls the accumulated pressure in the valve upper control chamber, causing main valve to modulate to an intermediate position and maintain the preset pressure value.

Open Position

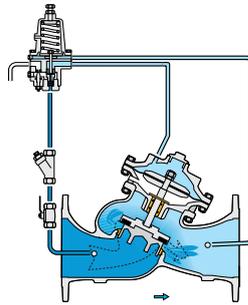

The open pilot valve releases line pressure from the upper control chamber. The line pressure acting on both the lower control chamber and the seal-disk, moves the valve to the open position.

3-Way Modulating Mode - Pressure Reducing

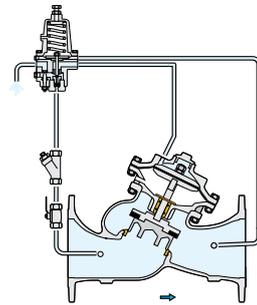

Closed Position

The pilot responds to high downstream pressure and introduces upstream pressure to the upper control chamber. The Double Chamber configuration ensures powered closing at zero flow.

Modulating Position

When the downstream pressure is equal to setting, the plunger in the pilot valve moves to block all passages and freezes the valve. The pilot valve responds to downstream pressure changes and moves the valve to maintain the setting by either venting or pressurizing the control chamber.

Open Position

When downstream pressure is lower than the setting, the plunger in the pilot valve moves to vent the pressure from the control chamber, allowing the valve to fully open. This minimizes pressure loss and ensures maximum possible downstream pressure. The 3-way control on the Double Chambered valves avoids the risk of a hydraulic lockout.

Plug Options

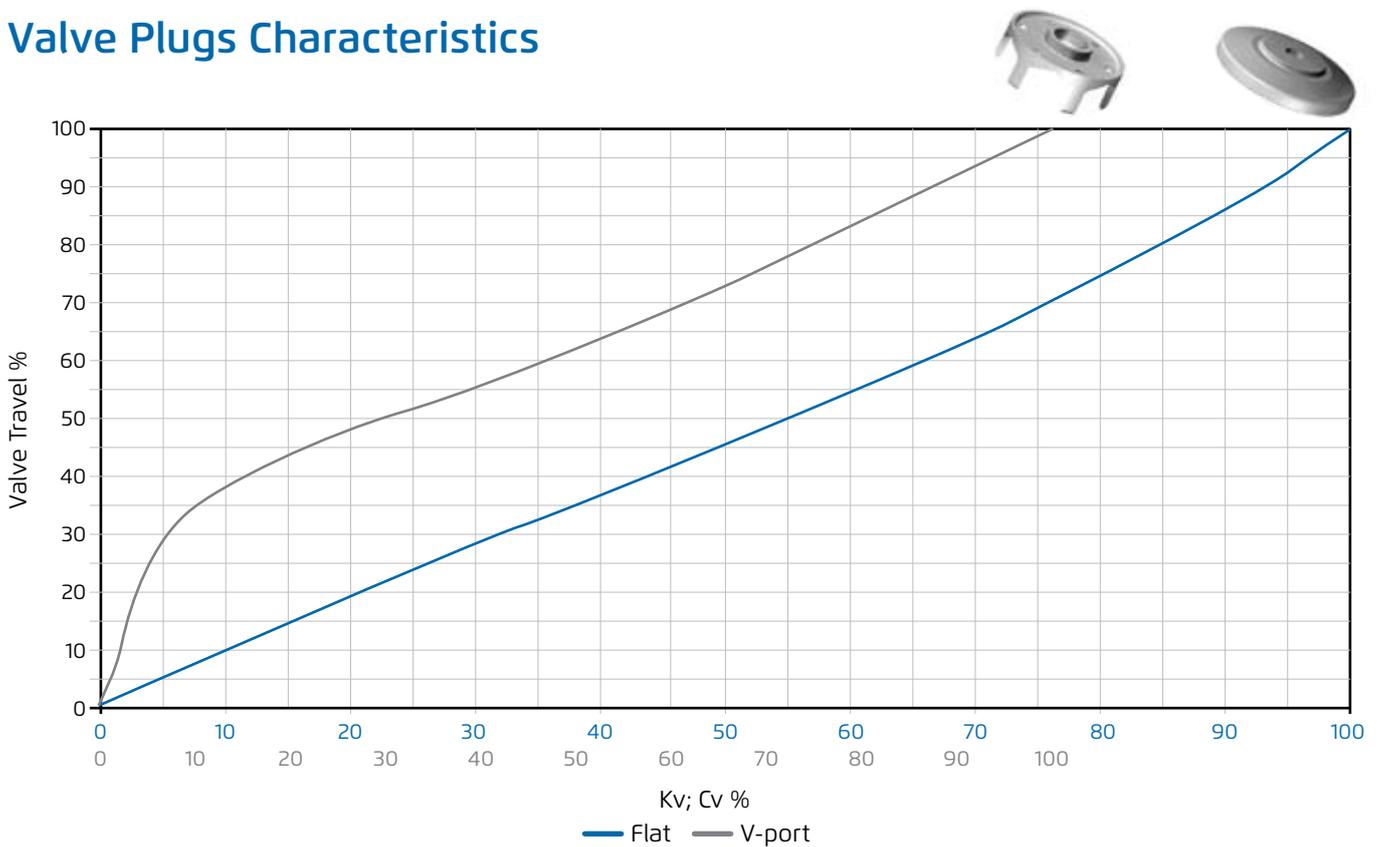

BERMAD's 700 series has various plug options to enable different valve characteristics.

Flat plug - standard plug for on-off and high flow applications.

V-Port plug - uniquely designed throttling plug. It changes the ratio of flow to stem travel allowing very wide flow range with relatively high pressure reduction and provides more accurate, stable and smoother response during pressure and flow regulation, while reducing noise and vibration.

BERMAD's 700 series plugs can easily be change before or after valve installation on site

Valve Plugs Characteristics

Cavitation

The cavitation phenomenon has a significant affect on control valve and system performance.

When the fluid's static pressure reaches liquid vapor pressure, vapor cavities (bubbles) form and grow until they violently implode by the recovered pressure downstream to the valve seat.

The implosion of these cavities generates high-pressure surges, micro jets and intensive heat, which erode valve components and downstream piping. In its final stage, cavitation flashes and chokes the flow.

Noise constraints:

The imploding vapor bubbles in the cavitation phenomena create a sonic wave in the fluid that upon impact with the pipe wall create vibrations that can result in disturbing noise levels.

Many factors affect the noise level generated by pipe fixtures, such as pipe material and wall thickness, installation rigidness, acoustic conditions in the installation space, fluid physical and chemical characteristics and many more.

In terms of hydraulic conditions, working at σ values greater than 0.5 with control valve can significantly reduce noise generation.

The Cavitation Guide is based on the formula commonly used in the valve industry:

$$\sigma = (P2 - Pv) / (P1 - P2)$$

Where:

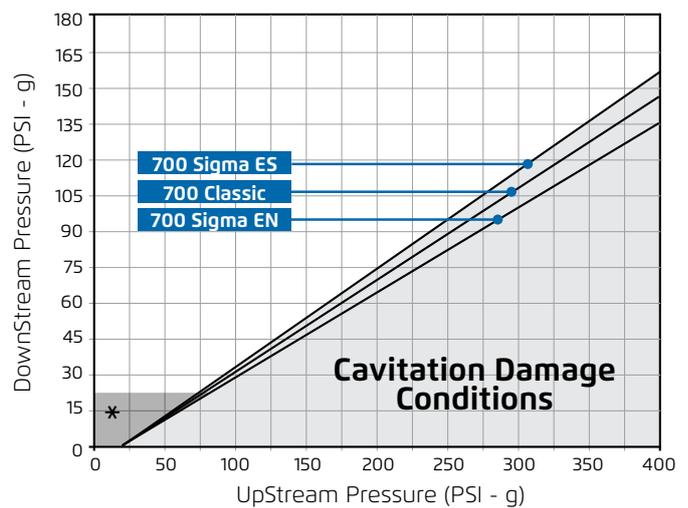

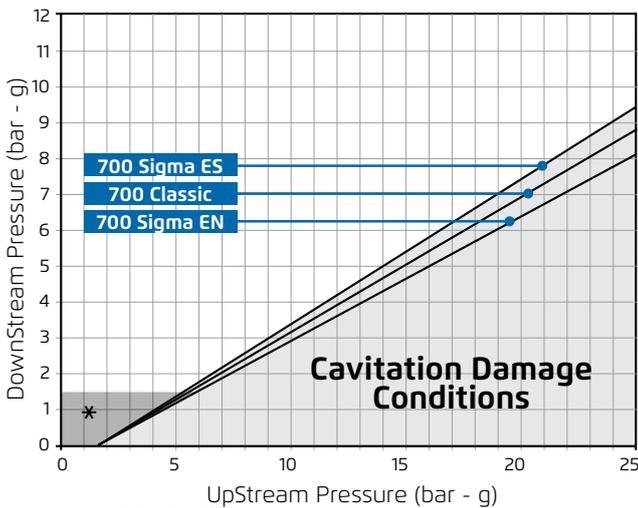

- σ = Sigma, cavitation index, dimensionless
- P1 = Upstream pressure, absolute
- P2 = Downstream pressure, absolute
- Pv = Liquid vapor pressure, absolute
(Water, 18°C = 0.02 bar-a ; 65°F = 0.3 psi-a)

Notes:

1. An alternate cavitation index formula introduced by ISA is:
 $\sigma_{ISA} = (P1 - Pv) / (P1 - P2)$ which equals $\sigma + 1$
2. The below charts should be considered only as a general guide.
3. For optimum system and control valve application please consult Bermad.

Cavitation Charts

The following charts represent cavitation conditions at 7 ft/s; 2 m/s with flat face plug

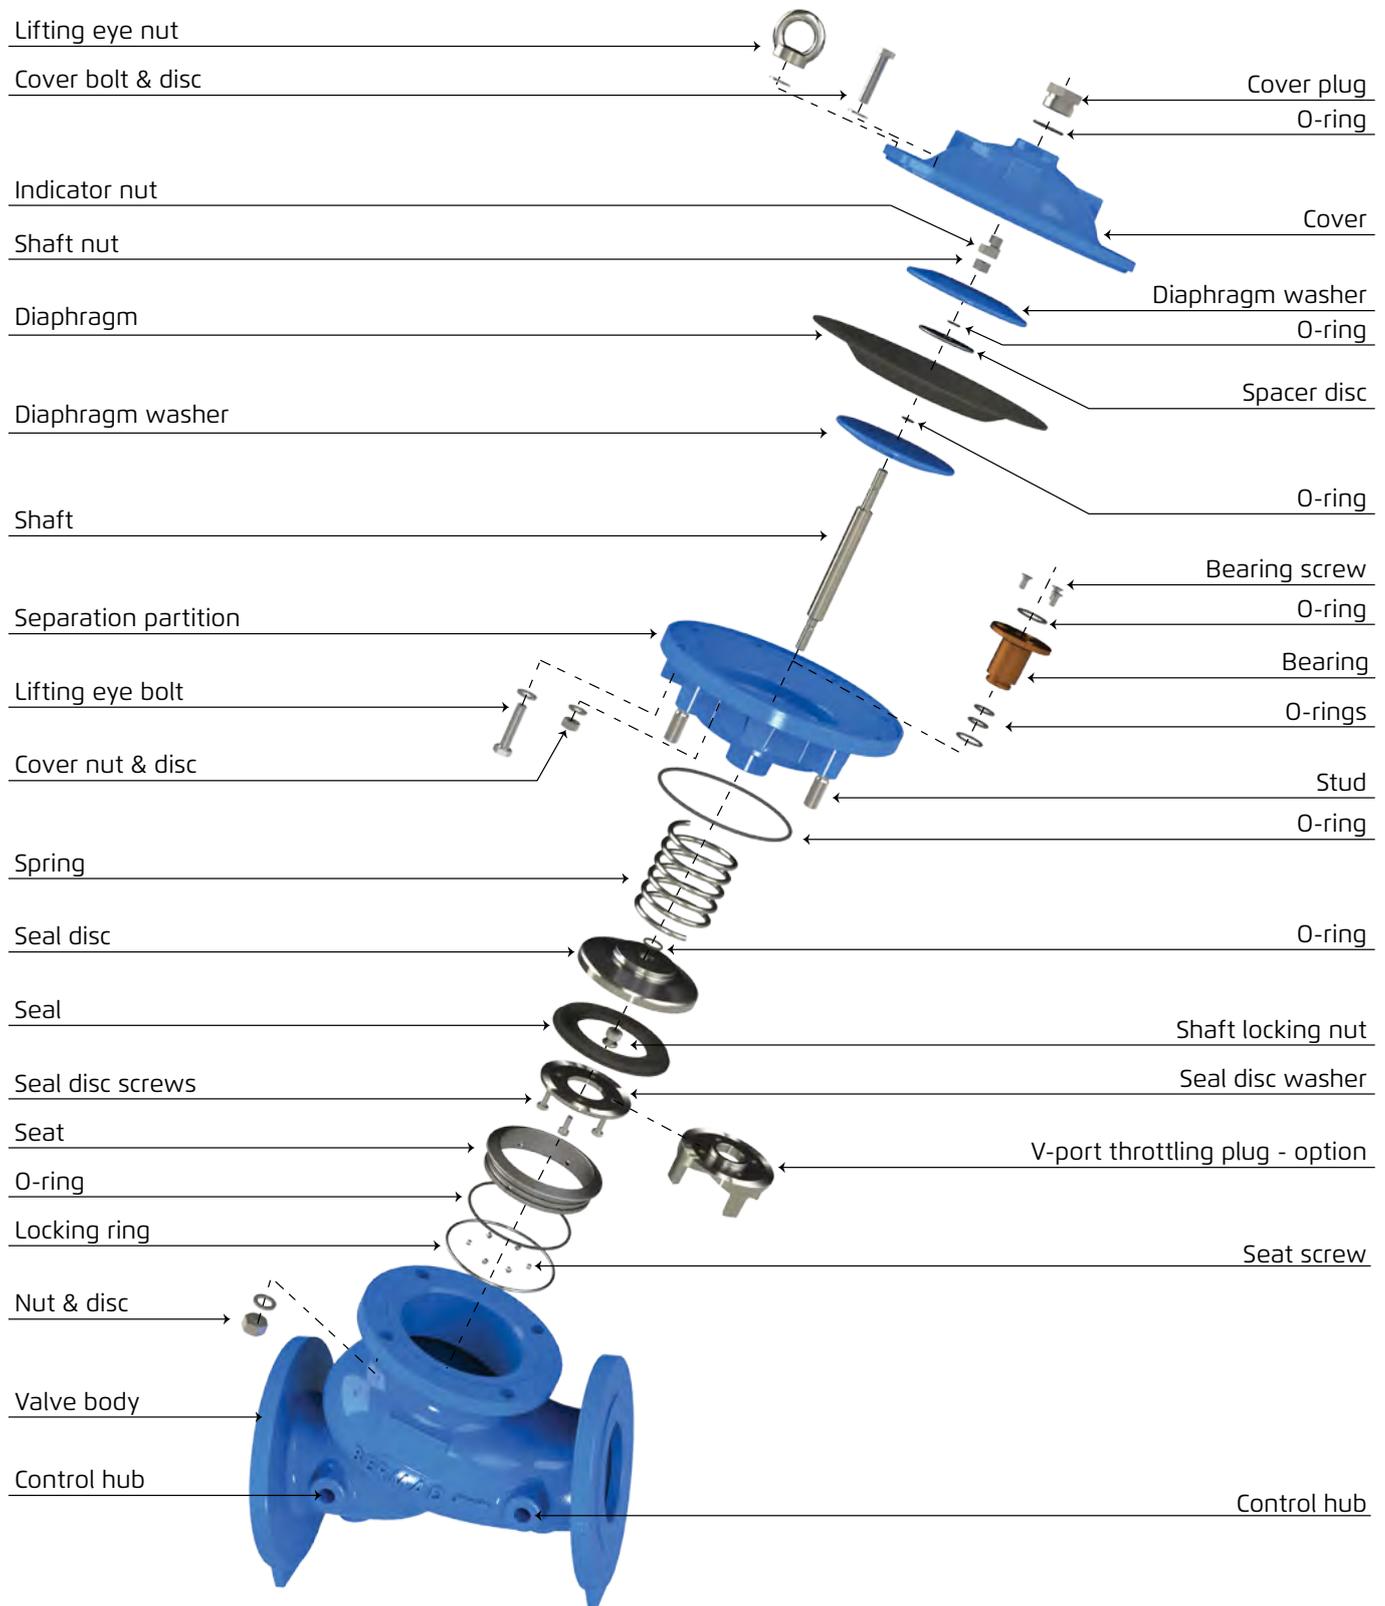

BERMAD can provide solutions for cavitation working conditions such as double stage reduction, cavitation cages and design support, contact the factory for more information.

Material Specifications

| Item Number | Description | Material (Standard) * | Material (Drinking Water) * |
|-------------|-------------------------------------|--|-----------------------------|
| 1 | Indicator Assembly (optional) | Stainless steel | |
| 2 | Cover | Fusion bonded Epoxy Coated Ductile Iron, EN 1563 or ASTM A-536 | |
| 3 | Diaphragm washer | Epoxy Coated Steel | |
| 4 | Diaphragm | Fabric-reinforced NBR | Fabric-reinforced EPDM |
| 5 | Separating Partition | Fusion bonded Epoxy Coated Ductile Iron, EN 1563 or ASTM A-536 | |
| 6 | Bearing | Bronze | Tin Bronze |
| 7 | Shaft | Stainless Steel, AISI 303 | |
| 8 | Spring | Stainless Steel, AISI 302 | |
| 9 | Seal Disc | Stainless Steel, AISI 410 | |
| 10 | Seal | NBR | EPDM / NBR |
| 11 | Seat | Stainless Steel, AISI 304 | |
| 12 | V-Port | Tin Bronze, Stainless Steel 316, POM | |
| | Flat Disc | Stainless Steel, AISI 304 | |
| 13 | Valve Body | Fusion bonded Epoxy Coated Ductile Iron, EN 1563 or ASTM A-536 | |
| | O-Rings | NBR | EPDM |
| | Internal Bolts | Stainless Steel, AISI 316/304 | |
| | External Bolts, Studs, Nuts & Disks | Stainless Steel, AISI 316 | |

* Other Materials Available on Request

700 SIGMA EN

Technical Data

Valve Patterns: "Y" (Globe)

Pressure Rating: 25 bar

End Connections: Flanged (all standards)

Plug Types: Flat disc, V-port, Cavitation cages

Temperature Rating: 60°C.

Optional higher temperature: Available on request

Standard Materials:

Body & actuator: Ductile Iron

Bolts, nuts & studs: Stainless Steel

Internals: Stainless Steel, Tin Bronze & Coated Steel, POM

Diaphragm: Fabric-reinforced synthetic rubber

Seals: Synthetic rubber

Coating: Dark blue Fusion bonded epoxy

For other materials contact BERMAD.

Differential Pressure Calculation

Valve flow coefficient, Kv or Cv $Kv(Cv) = Q \sqrt{\frac{Gf}{\Delta P}}$
Where:

Kv = Valve flow coefficient (flow in m³/h at 1bar ΔP)

Cv = Valve flow coefficient (flow in gpm at 1psi ΔP)
(Cv = 1.155 Kv)

Q = Flow rate (m³/h ; gpm)

ΔP = Differential pressure (bar ; psi)

Gf = Liquid specific gravity (Water = 1.0)

Practical formulas for water:

$$Q = Kv \sqrt{\Delta P} \quad \Delta P = \left(\frac{Q}{Kv} \right)^2$$

Flow resistance or Head loss coefficient, $K = \Delta H \frac{2g}{V^2}$
Where:

K = Flow resistance or Head loss coefficient (dimensionless)

ΔH = Head loss (m ; feet)

V = Nominal size flow velocity (m/sec ; feet/sec.)

g = Acceleration of gravity (9.81 m/sec² ; 32.18 feet/sec²)

Practical formula:

$$\Delta H = K \frac{V^2}{2g}$$

700 SIGMA EN

Technical Data

Valve Patterns: "Y" (Globe)
Pressure Rating: 400 psi
End Connections: Flanged (all standards)
Plug Types: Flat disc, V-port, Cavitation cages
Temperature Rating: 140°F.
Optional higher temperature: Available on request

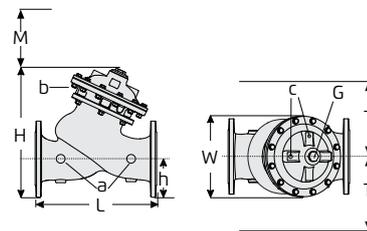

Standard Materials:
Body & actuator: Ductile Iron
Bolts, nuts & studs: Stainless Steel
Internals: Stainless Steel, Tin Bronze & Coated Steel, POM
Diaphragm: Fabric-reinforced synthetic rubber
Seals: Synthetic rubber
Coating: Dark blue Fusion bonded epoxy
For other materials contact BERMAD.

Differential Pressure Calculation

Valve flow coefficient, Kv or Cv $Kv(Cv) = Q \sqrt{\frac{Gf}{\Delta P}}$

Where:

Kv = Valve flow coefficient (flow in m³/h at 1bar ΔP)

Cv = Valve flow coefficient (flow in gpm at 1psi ΔP)
(Cv = 1.155 Kv)

Q = Flow rate (m³/h ; gpm)

ΔP = Differential pressure (bar ; psi)

Gf = Liquid specific gravity (Water = 1.0)

Practical formulas for water:

$$Q = Kv \sqrt{\Delta P} \quad \Delta P = \left(\frac{Q}{Kv}\right)^2$$

Flow resistance or Head loss coefficient, $K = \Delta H \frac{2g}{V^2}$

Where:

K = Flow resistance or Head loss coefficient (dimensionless)

ΔH = Head loss (m ; feet)

V = Nominal size flow velocity (m/sec ; feet/sec.)

g = Acceleration of gravity (9.81 m/sec² ; 32.18 feet/sec²)

Practical formula:

$$\Delta H = K \frac{V^2}{2g}$$
